CHAPTER 1 INTRODUCTION

PROJECT OVERVIEW

Machine learning and deep learning play an important role in computer technology and artificial intelligence. With the use of deep learning and machine learning, human effort can be reduced in recognizing, learning, predictions and in many more region.

Handwritten Digit Recognition is the ability of computer systems to recognise handwritten digits from various sources, such as images, documents, and so on. This project aims to let users take advantage of machine learning to reduce manual tasks in recognizing digits.

PURPOSE

Digit recognition systems are capable of recognizing the digits from differentsources like emails, bank cheque, papers, images, etc. and in different real-worldscenarios for online handwriting recognition on computer tablets or system, recognize number plates of vehicles, processing bank cheque amounts, numeric entries in forms filled up by hand (tax forms) and so on.

CHAPTER 2 LITERATURE SURVEY

EXISTING PROBLEM

The fundamental problem with handwritten digit recognition is that handwritten digits do not always have the same size, width, orientation, and marginssince they vary from person to person. Additionally, there would be issues with identifying the numbers because of similarities between numerals like 1 and 7, 5 and 6, 3 and 8, 2 and 5, 2 and 7, etc. Finally, the individuality and variation of each individual's handwriting influence the structure and appearance of the digits.

REFERENCES

Improved Handwritten Digit Recognition Using Convolutional Neural Networks(CNN) (2020)

Ahlawat, Savita and Choudhary, Amit and Nayyar, Anand and Singh, Saurabh and Yoon, Byungun

This paper's primary goal was to enhance handwritten digit recognition ability. Toavoid difficult pre-processing, expensive feature extraction, and a complex ensemble (classifier combination) method of a standard recognition system, they examined different convolutional neural network variations. Their current work makes suggestions on the function of several hyper-parameters through thorough evaluation utilizing an MNIST dataset. They also confirmed that optimizing hyper-parameters is crucial for enhancing CNN architecture performance. With the Adam optimizer for the MNIST database, they were able to surpass many previously published results with a recognition rate of 99.89%. Through the trials, it is made

abundantly evident how the performance of handwritten digit recognition is affected by the number of convolutional layers in CNN architecture. According to the paper, evolutionary algorithms can be explored for optimizing convolutional filter kernel sizes, CNN learning parameters, and the quantity of layers and learning rates.

An Efficient And Improved Scheme For Handwritten Digit Recognition Based On Convolutional Neural Network (2019)

Ali, Saqib and Shaukat, Zeeshan and Azeem, Muhammad and Sakhawat, Zareen and Mahmood, Tariq and others

This study uses rectified linear units (ReLU) activation and a convolutional neural network (CNN) that incorporates the Deeplearning4j (DL4J) architecture to recognize handwritten digits. The proposed CNN framework has all the necessary parameters for a high level of MNIST digit classification accuracy. The system's training takes into account the time factor as well. The system is also tested by altering the number of CNN layers for additional accuracy verification. It is important note that the CNN architecture consists of two convolutional layers, the first with 32 filters and a 5x5 window size and the second with 64 filters and a 7x7 window size. In comparison to earlier proposed systems, the experimental findings show that the proposed CNN architecture for the MNIST dataset demonstrates great performance in terms of time and accuracy. As a result, handwritten numbers are detected with a recognition rate of 99.89% and high precision (99.21%) in a short amount of time.

Improved Handwritten Digit Recognition Using Quantum K-Nearest Neighbor Algorithm (2019)

Wang, Yuxiang and Wang, Ruijin and Li, Dongfen and Adu-Gyamfi, Daniel and Tian, Kaibin and Zhu, Yixin

The KNN classical machine learning technique is used in this research to enable quantum parallel computing and superposition. They used the KNN algorithm withquantum acceleration to enhance handwritten digit recognition. When dealing with more complicated and sizable handwritten digital data sets, their suggested methodconsiderably lowered the computational time complexity of the traditional KNN algorithm. The paper offered a theoretical investigation of how quantum concepts can be applied to machine learning. Finally, they established a fundamental operational concept and procedure for machine learning with quantum acceleration.

Handwritten Digit Recognition Using Machine And Deep Learning Algorithms (2021)

Pashine, Samay and Dixit, Ritik and Kushwah, Rishika

In this study, they developed three deep and machine learning-based models forhandwritten digit recognition using MNIST datasets. To determine which model was the most accurate, they compared them based on their individual properties.

Support vector machines are among the simplest classifiers, making them fasterthan other algorithms and providing the highest training accuracy rate in this situation. However, due to their simplicity, SVMs cannot categorize complicated and ambiguous images as accurately as MLP and CNN algorithms can. In their research, they discovered that CNN produced the most precise outcomes for handwritten digit recognition. This led them to the conclusion that CNN is the most effective

solution for all types of prediction issues, including those using picture data. Next, by comparing the execution times of the algorithms, they determined that increasing the number of epochs without changing the configuration of the algorithm is pointless due to the limitation of a certain model, and they discovered that beyond a certain number of epochs, the model begins over-fitting the dataset and provides biased predictions.

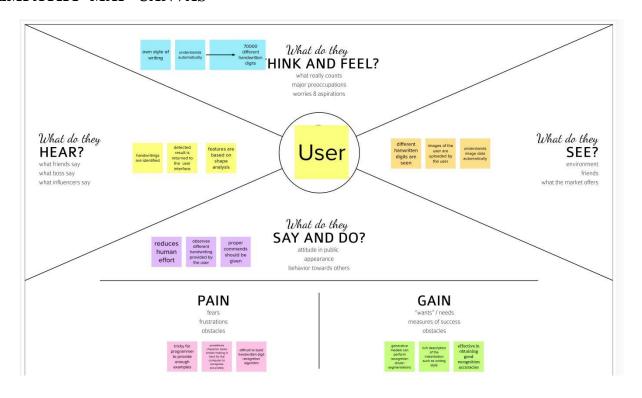

PROBLEM STATEMENT DEFINITION

For years, the traffic department has been combating traffic law violators.

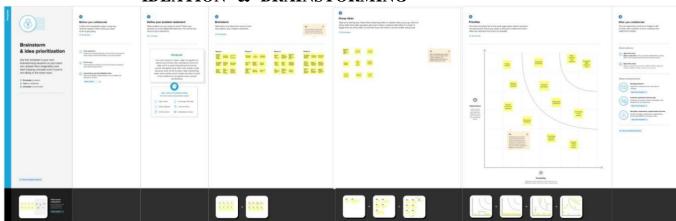

These offenders endanger not only their own lives, but also the lives of other individuals. Punishing these offenders is critical to ensuring that others do not become like them. Identification of these offenders is next to impossible because it is impossible for the average individual to write down the license plate of a reckless driver. Therefore, the goal of this project is to help the traffic department identify these offenders and reduce traffic violations as a result.

CHAPTER 3 IDEATION AND PROPOSED SOLUTION

EMPATHY MAP CANVAS

IDEATION & BRAINSTORMING

PROPOSED SOLUTION

S.NO	PARAMETER	DESCRIPTION
1	Problem Statement (Problem to be solved)	I am user trying to make a digit recognition to extract and remove the redundancy from the data, but it is quiet exhausting that human cannot recognise even their own return script because most of the humans digit handwriting looks more similar which makes me feel to build a new platform to recognise every unique handwriting.
2	Idea / Solution description	Input layer:Layer for calculation. Hidden layer:Provides nonlinear ties for network. Output layer:Final prediction of neural network.
3	Novelty / Uniqueness	OCR technology provides higher than 99% accuracy with typed characters in high quality images.
4	Social Impact / Customer Satisfaction	The system not only produces classification of the digit but also a rich description of the instantiation parameters which can yield information such as style writing.

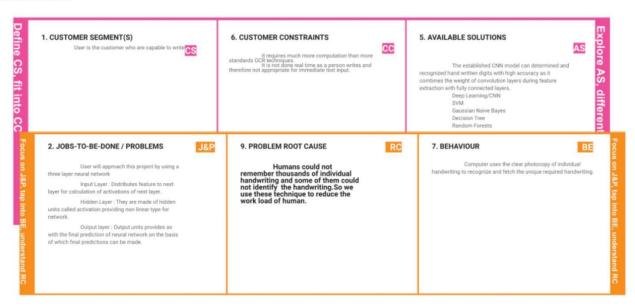

5	Slope Detail feature for handwritten digit recognition are based on shape analysis of the digit image and extract slant or slope information.
6	SVM classifier was the most accurate ,whereas decision tree were the least! hence we conclude that both interms of accuracy score and F1-score ,the SVM classifier performed the best .

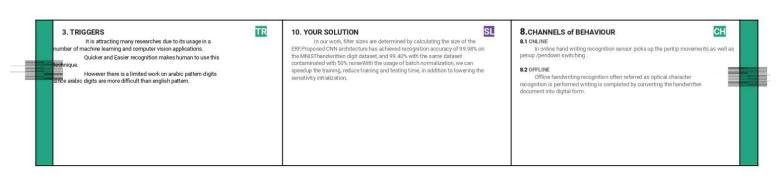

PROBLEM SOLUTION FIT

Project Title: Handwritten digit recognition

Team ID: PNT2022TMID48537

Project Design Phase-I - Solution Fit Template

CHAPTER 4 REQUIREMENT ANALYSIS

FUNCTIONAL REQUIREMENTS

FR.NO	FUNCTIONAL REQUIREMENTS	SUB REQUIREMENTS
		Get access the MNIST dataset
1	Model Creation	Analyze the dataset
1	Woder Creation	Define a CNN model
		Train and Test the Model
		Create a website to let the user recognize handwritten digits.
	Application Development	Create a home page to uploadimages
2		Create a result page to displaythe results
		Host the website to let the usersuse it from anywhere
		Let users upload images of various formats.
	3 Input Image Upload	Let users upload images of various size
3		Prevent users from uploading unsupported image formats
		Pre-Process the image to use iton the model

		Create a database to store allthe input images	
		Display the result from the model	
	Display Results	Display input image	
4		Display accuracy the result	
		Display other possible predictions with their respective accuracy	

NON FUNCTIONAL REQUIREMENTS

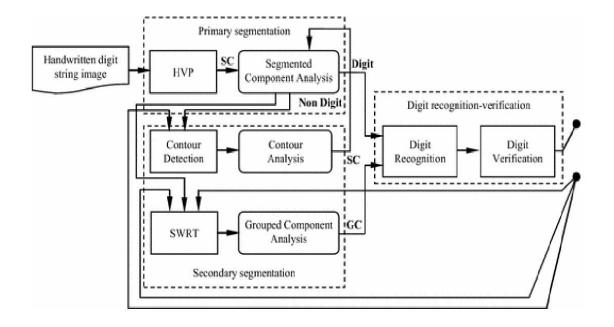

NFR. NO	NON-FUNCTIONAL REQUIREMENTS	DESCRIPTION
1	Usability	The application must be usablein all devices
2	Security The application must protect uploaded image	
3	Reliability	The application must give anaccurate result as much as possible
4	Performance	The application must be fast andquick to load up
5	Availability	The application must be available to use all the time
6	Scalability	The application must scale alongwith the user base

CHAPTER 5 PROJECT DESIGN

CHAPTER 9 RESULTS

PERFORMANCE METRICS

CHAPTER 10 ADVANTAGES & DISADVANTAGES

ADVANTAGES

- Reduces manual work
- More accurate than average human
- Capable of handling a lot of data
- Can be used anywhere from any device

DISADVANTAGES

- Cannot handle complex data
- All the data must be in digital format
- Requires a high performance server for faster predictions
- Prone to occasional errors

CHAPTER 11 CONCLUSION

This project demonstrated a web application that uses machine learning torecognise handwritten numbers. Flask, HTML, CSS, JavaScript, and a few other technologies were used to create this project. The model predicts the handwritten digit using a CNN network. During testing, the model achieved a 99.61% recognition rate. The proposed project is scalable and can easily handle a huge number of users. Since it is a web application, it is compatible with any device that can run a browser. This project is extremely useful in real-world scenarios such as recognizing number plates of vehicles, processing bank cheque amounts, numeric entries in forms filledup by hand (tax forms) and so on. There is so much room for improvement, which can be implemented in subsequent versions.

CHAPTER 12 FUTURE SCOPE

This project is far from complete and there is a lot of room for improvement. Some of the improvements that can be made to this project are as follows:

- Add support to detect from digits multiple images and save the results
- Add support to detect multiple digits
- Improve model to detect digits from complex images
- Add support to different languages to help users from all over the world

This project has endless potential and can always be enhanced to become better.Implementing this concept in the real world will benefit several industries and reduce the workload on many workers, enhancing overall work efficiency.
